

DsSoft x r/setupapp iCu X Official User Manual

iCu X may seem less complicated at the first glance but it is hard for some users to easily navigate through its UI, as I am not a professional UI designer I'll try my best here with explaining what does what

Installation: Download iCu X (iCures.zip) and extract it into your C:\ drive. It's that easy.

Usage: Just create a shortcut to desktop of the iCuXPrelaunch.exe file, double click it and accept the license terms. To actually use the Bypasses offered by iCu X click on "Experienced Mode", you should be shown a familiar screen just like the one of the Original iCu 23.X.X, from there just click on what you need and iCu X will do it for you.

New Home Screen explained: It may seem confusing why I decided to make the options that you came for less accessible but it was necessary to prevent unlucky events altering the state of your device, during testing my cat decided to take a nap on my numpad and arrow keys and completely lag out my testing PC AND Soft-brick my iPad. The home screen is just for show and to inform you what bypasses you can and cannot use on your device as well as faster access to settings.

Error codes and error handling: iCu X has been made like it is to avoid confusing to me AND to you unhandled errors, iCu X catches the error before the JIT framework does and actually tells you what happened (most of the time, still not perfect).

Error 001: Update related error pointing to missing update files. DELETE leftovers, try updating again

Manual code 002: iCu X tells you that you need to delete the iCures folder manually as it has no uninstaller yet.

No valid iCuFS file provided: iCuFS files need to be in the iCures folder, correctly compressed in the zip format and be named iCuPlus.zip

Error 003: There is a leftover iCuPlus.zip in your iCures folder, delete it and the UpdateData directory too.

Developer code -10: Restart the iCu X program, you don't need to use developer tools.

Developer code -11: Used by me to test stuff, ignore it not an error just tells you it worked.

Server Checker codes: Success means that the server is up and running, this applies to the websites only though, the activation server showing TimedOut is perfectly fine.
